RVK Credit & Payment Controls: Technical Overview

Odoo 19 Enterprise · repository folder `Projects/RVK` (not yet under git) · 3 modules · OdooTec proprietary licence (ODTL-1) · October 2026

1. What this repository does

These modules put the company's credit and payment rules into Odoo, so they are applied every time instead of being remembered. On the sales side, a quotation only leaves on a payment term that was agreed and approved, with the advance that special items need. When an order is confirmed, the customer's credit sales of the month are checked against the customer's cap and the company's monthly ceiling, and an order over either waits for the Finance Manager. A nightly check moves customers with overdue invoices onto a watch list, and later onto credit hold, which stops new orders and deliveries until Finance releases them. On the purchasing side, a vendor bill can only be paid once it matches its purchase order and receipt, larger vendor payments wait for one, two or three approvals by amount, a payment that repeats an earlier one is blocked, and money never goes to an untrusted bank account or from a shareholder onto a payroll expense account.

2. How it is put together

Three domain modules, each extending the Odoo records it controls, with no parallel models: the credit state lives on the contact, the ceiling and thresholds on the company, the advance share on the payment term, the special mark on the product, and the approvals on the quotation and the payment. The only new models are `credit.exposure` (a read-only SQL view of monthly credit sales), `payment.approval` (one row per approval given) and the `credit.decision` dialog. There is no suite (meta) module and no localization module: the three modules are installed directly, and nothing in them is specific to one country (amounts are in the company currency).

Layer	Modules	What it is for
Domain	odt_customer_credit_control	Monthly credit ceiling and caps, customer credit states, blocks on orders, deliveries and invoices.
Domain	odt_quotation_payment_terms (builds on the one above)	Checks before a quotation is sent, and the two quotation approvals.
Domain	odt_supplier_payment_control	Matched bills only, approval levels, duplicate block, trusted accounts, shareholders.
Odoo apps extended	Sales, Inventory, Accounting, Purchase; Enterprise: Accounting, Batch Payment, Release to Pay	The standard flows stay; each control runs first, then calls the standard method.

3. The modules at a glance

Module	What it does	Builds on
odt_customer_credit_control	Counts each customer's credit sales per month (orders not on a 100 % advance term, with VAT). Confirming over the customer's cap or the company's ceiling waits for the Finance Manager. Keeps the credit state (Normal, Watch List, Credit Hold, Absolute Block) with a nightly check and a weekly watch-list email.	sale_management, stock, account
odt_quotation_payment_terms	Refuses to send a quotation with no payment term, with a special item below the company's minimum advance, on a term other than the customer's default without the Finance Manager's approval, or to a watch-listed customer without the Operations or Finance Manager's approval. Shows the special mark on sales and purchase lines.	sale_management, purchase, odt_customer_credit_control
odt_supplier_payment_control	Refuses to pay vendor bills whose Should Be Paid is not Yes (service bills without a purchase order are exempt), alone or in a batch. Vendor payments above three company thresholds need the Finance Manager, then the Operations Manager, then the Chief Executive; duplicates wait for an administrator.	account_accountant, account_batch_payment, purchase, account_3way_match

4. How a sale and a vendor payment move through the system

#	What happens	Handled by
1	**Quotation.** The quotation shows the customer's share of the ceiling this month and their cap. No quotation can be saved for a customer under Absolute Block.	odt_customer_credit_control
2	**Send.** Pressing *Send* checks, in order: a payment term is set; special items get the minimum advance; a non-default term is approved; sending to a watch-listed customer is approved.	odt_quotation_payment_terms
3	**Confirm.** Credit Hold or Absolute Block: refused. Over the cap or the ceiling: the order waits, and the Finance Manager approves it with a reason, which confirms it.	odt_customer_credit_control
4	**Deliver and invoice.** Deliveries to held or blocked customers cannot be validated; invoices to blocked customers cannot be posted.	odt_customer_credit_control
5	**Every night.** An overdue invoice puts the customer on the Watch List; one overdue by more than the company's hold days (60 by default) puts them on Credit Hold. Only the Finance Manager lifts a hold or a block.	odt_customer_credit_control
6	**Vendor bill.** Register Payment and batch validation refuse bills whose Should Be Paid is not Yes, naming them.	odt_supplier_payment_control
7	**Vendor payment.** It stays in draft until each level its amount needs is approved, and a duplicate until an administrator releases it. Untrusted bank accounts and shareholder payments to payroll accounts are refused.	odt_supplier_payment_control

5. Installing and setting it up

- **What you need:** Odoo 19 **Enterprise** (Supplier Payment Control needs Accounting, Batch Payment and Vendor Bill: Release to Pay) and PostgreSQL. No extra Python packages.
- **Addons path:** point it at the repository folder itself, then *Apps* → *Update Apps List*. Install *Customer Credit Control*, *Quotation Payment Terms* and *Supplier Payment Control* (the second brings the first with it).
- **People:** the Finance Manager needs *Accounting / Administrator*, Finance users who flag customers *Accounting / Invoicing*. The Operations and Finance Managers get *Quotation Approval / Quotation Send Approver*; the Operations Manager and the Chief Executive get *Vendor Payment Approval / Payment approver (Operations)* and *(Chief Executive)*. Releasing a duplicate needs *Administration / Settings*.
- **Company form:** the *Credit Control* tab (monthly ceiling, hold days, special items minimum advance) and the *Payment Approval* tab (the three thresholds). A 0 switches that rule off.
- **Records:** the *Advance (%)* on each payment term, *Special Item* and *Excluded from Credit Totals* on products, each customer's cap and default payment term, *Shareholder* on contacts, *Payroll Expense Account* on accounts, and trusted vendor bank accounts.
- **Scheduled actions:** *Credit Control: nightly credit check* (daily) and *weekly watch-list email*.

6. Notes for developers

- **House style:** the OdooTec module standard: `odt_` prefix on module names only, black formatting, docstrings, a *string* and *help* on every field, the ODTL-1 licence and a README per module.
- **Every override checks first, then calls** `super()`, so the standard flow is untouched when a rule passes. Each override has a negative, a normal and a standard-preserved test (`tests/test_overrides.py`).
- **Credit totals** are read only from the `credit.exposure` view; call `invalidate_model()` before reading it inside a transaction. **Send checks** live in `sale.order._check_quotation_send()`.
- **Vendor payments** are checked in `account.payment.action_post`; Register Payment sets `defer_payment_approval` so waiting payments stay in draft, and `_generate_journal_entry` puts back to draft a waiting payment that standard would otherwise mark In Process.
- **Tests:** 74 (credit control 32, quotation terms 14, supplier payments 28), all passing. On a new database:

```
./odoo-bin -c odoo.conf -d -i
odt_customer_credit_control,odt_quotation_payment_terms,odt_supplier_payment_control --test-enable
--test-tags=/odt_customer_credit_control,/odt_quotation_payment_terms,/odt_supplier_payment_control
--stop-after-init
```

7. What to keep in mind

- **Fixed on 15 October 2026:** a vendor payment needing approval could skip it when its payment method has an outstanding account. Fixed in `_generate_journal_entry`, with a new test.
- **Checker:** Quotation Payment Terms and Supplier Payment Control score 100. Customer Credit Control scores 87 for three warnings: it extends three apps as one credit policy (SCO004, splitting is a design decision), the `credit.decision` dialog has no list or search view (UX001, a dialog needs none), and STR004 is read from the parent Odoo source tree because this folder is not a git repository yet; its own `.gitignore` already covers the rule.
- **The *Over Cap* filter** on Credit Exposure lists every customer that has a cap, not only those above it.
- **Not checked:** *Mark as Sent*, and re-sending a confirmed order. Returned instrument deposits (REQ-026) do not yet put a customer on the watch list. Credit months are counted in UTC.
- **Payments:** no approval is asked until a company sets its thresholds; one click gives one level; releasing a duplicate leaves the earlier payment as it is. There is no daily payment run.

Each remaining item is listed, with its reason, in the Module Completeness Checklist sent with this overview.
