Overview

What the module does

The module gates the **Send** button of a quotation. A quotation (`state` in `draft`, `sent`) is sent only if it has a payment term, if that term's advance reaches the company's special-item minimum when a special product is on the quotation, if the term is the customer's default or approved by a Finance Manager, and if sending to a watch-listed customer was approved by a send approver. The checks live in `sale.order._check_quotation_send()` (`models/sale_order.py:276`), called by an override of `action_quotation_send()` before `super()` (`models/sale_order.py:174`). Approvals are stored on the order (user and datetime) and lapse when what they approved changes. A related `is_special` field carries the product's special mark to sale and purchase order lines.

Design

Model	New / inherited	Role
`sale.order`	inherited	Four approval fields, two computed flags, send checks, approval actions, lapse logic in `write()`
`sale.order.line`	inherited	`is_special`, related to `product_id.is_special`
`purchase.order.line`	inherited	`is_special`, related to `product_id.is_special`
`res.company`	inherited	`special_min_advance` (Float, 0–100, constraint at `models/res_company.py:35`)

Key flows and decisions

- **Override point.** Only `action_quotation_send` is overridden. The standard composer runs unchanged once the checks pass, so a compliant quotation is sent exactly as standard. Consequence: `action_confirm`, printing, preview and the portal are not gated (see Open points).
- **Check order.** No term → special-item minimum → term approval → watch-list approval. The first failure raises a `UserError`; only one problem is reported at a time. The special minimum is checked before and independently of the term approval, so an approved term does not lift it. Comparison uses `float_compare(..., precision_digits=2)`; a term exactly at the minimum passes.
- **Computed flags.** `is_term_approval_needed` and `is_send_approval_needed` are non-stored computes. They drive the banners and buttons in the form and are re-read by the send check. The "default term" is `partner_id.commercial_partner_id.with_company(company_id).property_payment_term_id`; a customer without a default term therefore makes every term need approval.
- **Approval writes.** `action_approve_payment_term` (group `account.group_account_manager`) and `action_approve_sending` (group `odt_quotation_payment_terms.group_send_approver`)

check the group with `has_group`, refuse if no approval is needed, then write with `sudo()`. `write()` refuses a non-superuser write that sets an approval field without the matching group (`AccessError`).

- **Lapse.** In `write()`, changing `payment_term_id` clears the term approval; changing `partner_id` clears both approvals. Clearing runs in `sudo()` because it only makes the check stricter. A change of the customer's credit state or default term after approval does not clear anything.
- **Watch-list scope.** Only `credit_state == 'watch'` triggers the sending approval. Hold and block are left to `odt_customer_credit_control` (confirmation refused; quotations for blocked customers cannot be saved).
- **Tracking.** `term_approved_by_id` and `send_approved_by_id` have `tracking=True`; approvals appear in the chatter.
- No hooks, crons, controllers, reports, wizards or new models. No `post_init_hook` or `uninstall_hook`.

Views

View (xml id)	Inherits
`view_order_form_inherit_quotation_payment_terms`	`sale.view_order_form`
`purchase_order_form_inherit_quotation_payment_terms`	`purchase.purchase_order_form`
`view_company_form_inherit_quotation_payment_terms`	`odt_customer_credit_control.view_company_form_inherit_`

Dependencies

Odoo modules

Module	Why it is needed
`sale_management`	Quotations, `action_quotation_send`, the sale order form
`purchase`	`purchase.order.line` and its form, for the special mark
`odt_customer_credit_control`	`account.payment.term.advance_pct`, `product.template.is_special`, `res.partner.credit_state`, and the company form page this module extends

`account` is used directly (`account.group_account_manager`) and arrives through `sale_management`.

External dependencies

None declared, and no third-party import was found in the module code. The tests import `freezegun` (`tests/common.py:13`), which ships with Odoo's own test requirements.

Prerequisites

Installation order

Install **Quotation Payment Terms**; Odoo installs `odt_customer_credit_control` first if it is missing. No data migration is needed: existing quotations simply start being checked at the next **Send**.

Required configuration

- Company: **Special Items Minimum Advance (%)** in **Settings › Users & Companies › Companies**, Credit Control tab. 0 disables the special-item check.
- Payment terms: **Advance (%)** (`advance_pct`, from `odt_customer_credit_control`) on every term used for special items. The value is entered by hand; it is not derived from the term lines.
- Customers: a default payment term (`property_payment_term_id`, company-dependent). Without it every quotation term needs Finance approval.

Required data

Products to be secured by an advance must have **Special Item** ticked (`product.template.is_special`). No data file is shipped; the module loads only `security/security.xml` and three views.

Access rights

Group	Defined in	What it allows here
Quotation Approval / Quotation Send Approver (`group_send_approver`)	this module, privilege `res_groups_privilege_quotation_approval` in the Sales category; implies `sales_team.group_sale_salesman`	**Approve Sending** button and action
Accounting / Administrator (`account.group_account_manager`)	`account`	**Approve Payment Term** button and action; sees the company Credit Control page
Sales / User	`sales_team`	Create and send quotations

No new model, so no `ir.model.access.csv` and no record rule. The Finance Manager needs a Sales role as well: in the demo database a user holding only Accounting / Administrator got an `AccessError` on `sale.order.spreadsheet_ids` (Quotation Spreadsheet, Enterprise) when opening the quotation list. The code comment at `models/sale_order.py:203` ("the Finance Manager need not hold sales rights") holds for the write only. The README installation step 3 already asks for Quotation Send Approver for Finance Managers, which fixes it.

Quality

Tests

14 test methods in 2 files, all imported by `tests/__init__.py`, tagged `post_install`, `-at_install`, `odt_quotation_payment_terms`:

File	Methods	Covers
`tests/test_quotation_send.py`	11	No term, non-default term refused, Finance approval, special minimum below and at the limit, special mark down to purchase, watch-list refusal and approval, Sales Manager refused, salesperson / Sales Manager / Operations Manager cannot approve a term, term change lapses approval
`tests/test_overrides.py`	3	`action_quotation_send` negative, normal (composer opens) and standard-preserved (template, attachment, instalment due dates)

Execution: these tests were not run during this documentation run. They were executed by the delivery team on 2026-10-15 on a fresh database (`v19_rvk_docs`, all three RVK modules installed with `--test-enable`): the full RVK suite ran 74 tests with 0 failures and 0 errors, of which 14 belong to this module.

Not covered by tests: lapse of the sending approval on a customer change, the `write()` guard on direct approval writes, the "does not need approval" `UserError`s, the company constraint, and multi-company default terms.

Licence and authorship

Manifest licence `Other proprietary`; author OdooTec; website https://www.odootec.com; no `maintainer` key. A `LICENSE` file is present (OdooTec Development Licence ODTL-1, version 1.4), consistent with the README.

Compliance with the OdooTec module standard

Compliance with the OdooTec module standard was not checked: the standard reference file is empty.

Open points

Unfinished work

No TODO, FIXME or XXX comments, stub methods, missing data files or unimported Python files were found. Findings from code reading and the demo database:

#	Finding	Evidence
1	Confirming a quotation is not gated: a quotation with no term, an unapproved term or a special item below the minimum can be confirmed directly. The README limitations list Mark as Sent and re-sent confirmations, not **Confirm**, **Print**, **Preview** or the portal. Decide whether this is accepted or whether `action_confirm` should run the same checks.	`models/sale_order.py:174` (only override); README "Known Limitations"
2	Layout fault in the dependency: `advance_pct` is inserted before `early_discount` inside the `o_field_highlight` div, so on the payment term form the advance value shows without its own label, next to the **Early Discount** label. Users can mistake one for the other. Fix belongs in `odt_customer_credit_control`.	`odt_customer_credit_control/views/account_payment_term_views.xml`; `account/views/account_payment_term_views.xml:46-48`; observed on screen 2026-10-15
3	A Finance Manager without a Sales role cannot open quotations (AccessError on `sale.order.spreadsheet_ids`), so cannot reach **Approve Payment Term**. Configuration requirement rather than code bug; the code comment suggests otherwise.	`models/sale_order.py:203`; observed with a user holding only Accounting rights
4	Approvals are not cleared when the customer's default term or credit state changes after approval; only term and customer changes on the quotation clear them. Probably intended; not documented.	`models/sale_order.py:132-168`

Translations

`i18n/ar.po`: 40 entries, 0 missing from the static extraction, 0 untranslated, 0 fuzzy. `i18n/odt_quotation_payment_terms.pot`: 40 entries, no source string missing. Extraction is static and approximate; Odoo's own export may differ slightly. The Arabic catalogue was not checked on screen.

Reports

The module defines no QWeb report. The standard quotation PDF is not changed.

Documentation gaps

- Tests were counted, not executed, in this run; the cited results come from the delivery team's run of 2026-10-15.
- The automatic evidence scan did not list the module's `UserError` messages as troubleshooting items (they use `self.env._(...)`); they were taken from the code by hand (`models/sale_order.py:290-337`).
- The functional screenshots stop at the email window; no email was actually sent in the demo database.
- Multi-company behaviour (per-company minimum and default terms) was read from the code only.
